WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

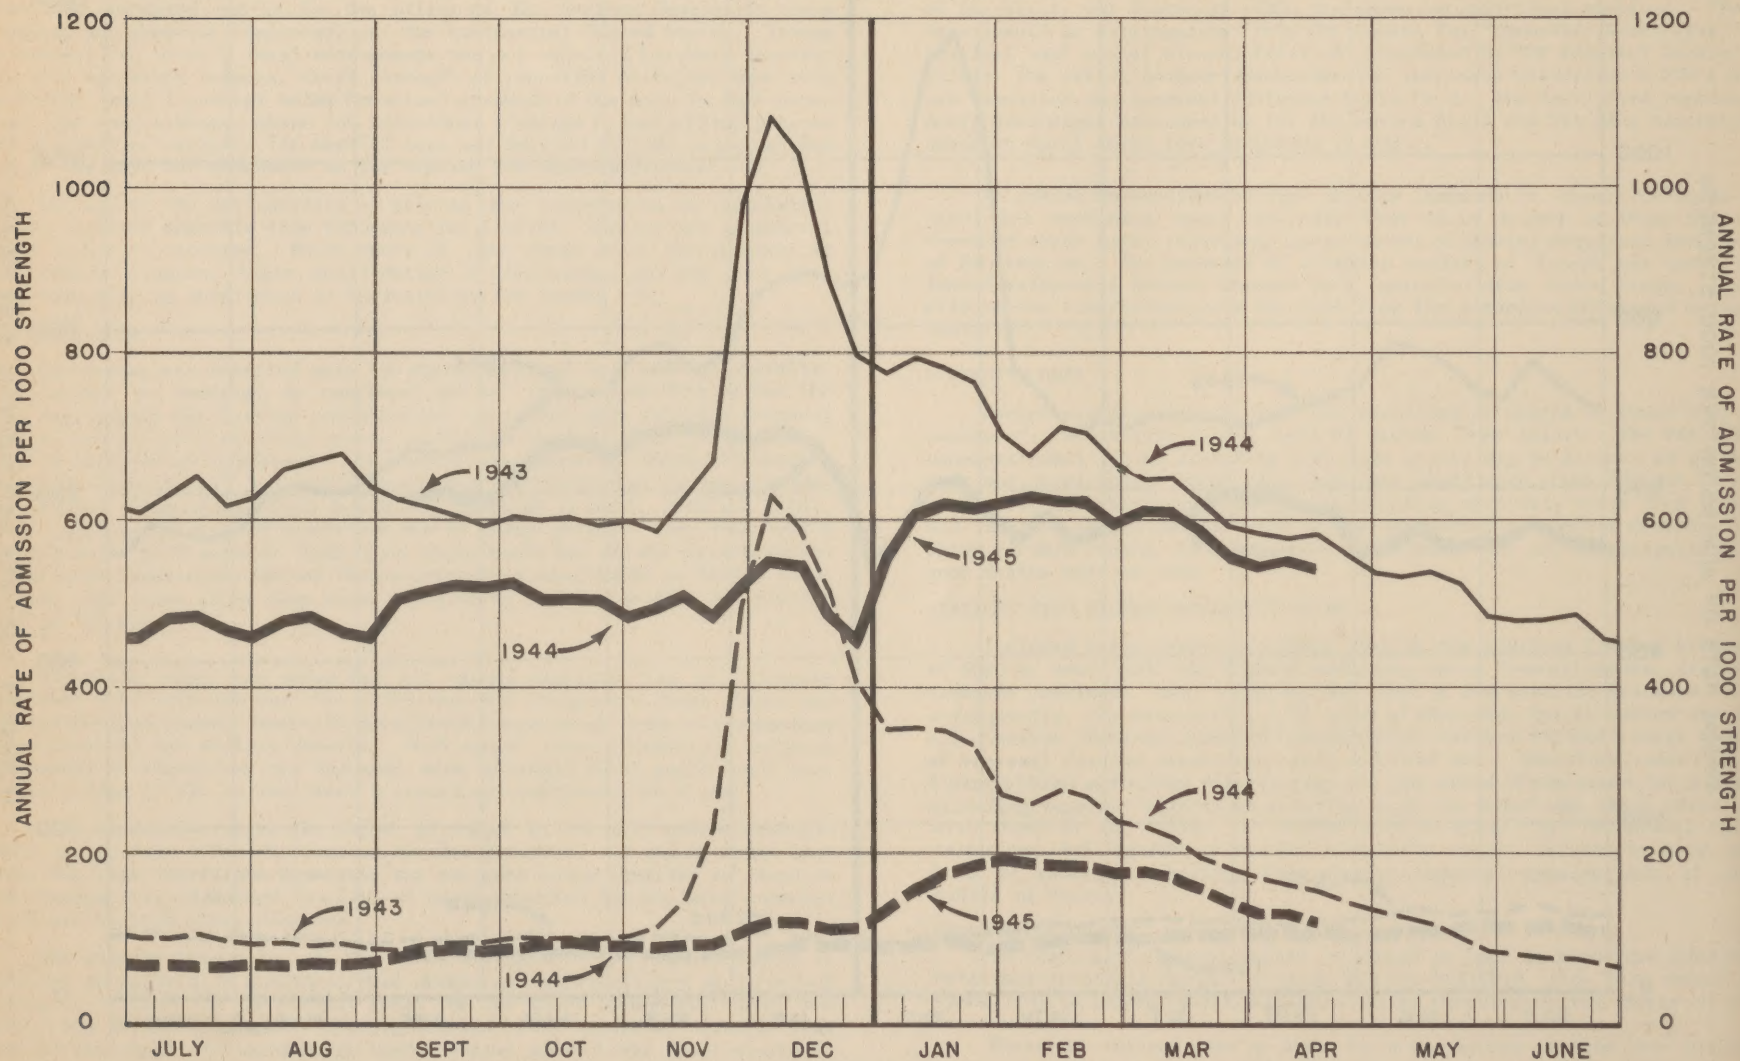

MORBIDITY FROM ALL CAUSES INJURY ONLY

MORBIDITY FROM DISEASE ONLY COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES:All Causes: Disease and Injury:

Morbidity from all causes decreased slightly (by about 2 percent) during the week ending 20 April 1945, being reported at 590 per year per thousand strength which is the lowest rate recorded so far this year. The current week's admission rate is about 10 percent lower than that for the corresponding week of 1944, with more than half of the difference being due to lower morbidity from respiratory causes. Morbidity from disease decreased correspondingly, being reported at 543 per thousand.

The admission rate from injury decreased to 47 per thousand to equal the record low rate reported at the end of February. However, it should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and of readmissions for injury under "disease" rather than under "injury", as was formerly done.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased for the sixth consecutive week being reported at 120 per thousand. The current week's rate is 25 percent lower than for the corresponding week of 1944 and is the lowest registered so far this year even though somewhat above the experience for December 1944.

The admission rate for pneumonia decreased slightly to 11 per thousand which is the lowest rate reported so far this year and is slightly lower than for the corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry on active service remained at the relatively high level of 44 per thousand. This reflects in part the normal cyclical trend during the month since the lowest rate usually occurs during the first week, followed by a steady rise thereafter until the end of the month. The current week's rate is above the highest rate reported during any week of 1944.

The admission rate from diarrhea and dysentery remained at 6 per thousand which reflects the anticipated low seasonal level.

The numbers of new cases of measles and scarlet fever remained at about the same figures as during the previous three weeks, but the number of new cases of mumps continued to decline; this trend in mumps morbidity has been noted during the past four weeks. The number of new cases of infectious hepatitis decreased to 69 which is the lowest figure reported since the beginning of March. The outbreak of poliomyelitis at Fort McClellan, Ala. has appreciably subsided and only 2 new cases were reported during the current week (no deaths), with 16 cases remaining under treatment at the end of the week.

VARIATION IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate for disease decreased in all Service Commands, with the greatest decreases (about 5 percent) being reported by the First, Second and Seventh Service Commands. The Second and Ninth Service Commands reported the highest morbidity from all causes (about 625 per thousand) and from disease (about 580 per thousand). The lowest admission rates

COMMENT ON CURRENT TRENDS (CONT'D)

from all causes (489 per thousand) and from disease (454 per thousand) were again reported by the Military District of Washington, with the First and Seventh Service Commands being the ones with the next lowest rates.

The Fourth, Eighth, and Ninth Service Commands reported the highest morbidity from injury (about 55 per thousand), while all other Service Commands reported rates of 43 per thousand or less.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased in all Service Commands except the Ninth and the Military District of Washington where small increases were reported. The highest morbidity from these causes was reported by the Eighth Service Command (142 per thousand), while the lowest was registered by the First and Third Service Commands (about 95 per thousand).

The admission rate from pneumonia remained substantially unchanged in most Service Commands. The Eighth Service Command reported the highest morbidity from this cause (17 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases showed relatively little change in the various Service Commands, no Command reporting a change from the previous week's admission rate appreciably in excess of 10 percent. The highest morbidity from these causes was reported by the Third Service Command (68 per thousand), followed by the Second Service Command (58 per thousand); both of these Commands had relatively high experience because of the presence of task force troops not under their jurisdiction.

All Service Commands continued to report exceptionally low morbidity from diarrhea and dysentery, with no Command having a rate in excess of 8 per thousand. The outbreak of respiratory diseases at Sioux Falls AAF, S. Dak. abated although 2 new cases of mumps, 13 new cases of scarlet fever, and 22 new cases of streptococcal sore throat were reported.

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States based on revised data is estimated at 31.8 per thousand strength for the week ending 20 April as compared with approximately 33 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, rose to 93 per thousand.

PATIENTS REMAINING UNDER TREATMENT: 20 April 1945

The number of neuropsychiatric cases remaining was 35,629 or about 800 more than at the end of the previous week. Non-battle injury patients remaining numbered 46,900. The number of battle casualty patients remaining increased by about 4,000 to number 80,364.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 20 April there were 4,407 enlisted men discharged by CDD or about 25 more than the previous week. About 51 percent of these discharges were reported by General Hospitals. Included among the 4,407 CDD's were 1,734 neuropsychiatric cases.

FORM SG-902 - 8 July 1944

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS

FOR THE FIVE WEEK PERIOD ENDING 30 MARCH 1945

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 30 March 1945 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 25. Similar charts for specified diseases appear on pages 27, 29, and 31. A chart showing mortality trends is presented on page 33. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 36. The most pertinent morbidity data for individual stations are presented on pages 37 to 58. On pages 59 and 60 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this

reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY:

The admission rates from all causes and from disease for the Army in the continental United States decreased by about 5 percent in March. The Navy shore stations in this country also reported somewhat lower morbidity in March. The Army's admission rate from disease during March (592 per thousand) was about 7 percent lower than for March 1944. Almost all of the higher morbidity during March 1944 as compared with March 1945 arose from respiratory causes.

Morbidity from all causes and from disease during the first three months of 1945 was about 15 percent lower than for the corresponding period of 1944.

The admission rate from injury decreased slightly in March to 49 per thousand which is by far the lowest rate on record. However, the recent experience is not strictly comparable with that prior to October 1944 because the relatively low level of injuries since that time reflects in part at least compliance with the directive issued 29 September 1944 which required readmitted and EPTS injuries to be reported as "disease" and not as "injury".

Lower morbidity from disease during March as compared with February was reported by every Service Command except the Seventh where a small rise was reported.

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Decreases in morbidity of 10 percent or more were reported only by the Military District of Washington and the Third Service Command.

The First and Second Service Commands reported the highest morbidity rates from all causes and from disease in March (both being only about 10 percent higher than for the country as a whole), closely followed by the Third and Fifth Service Commands. The lowest admission rates from all causes and from disease were registered in the Military District of Washington and the Fourth and Seventh Service Commands (all about 5 percent lower than for the country as a whole). It may thus be noted that there was relatively very little spread between the morbidity rates of the Service Commands having the lowest and highest rates, although in previous winters the range of variation was usually much wider.

The admission rate from injury decreased in most Service Commands although slight rises were reported in the two largest Commands—the Fourth and the Eighth. The highest morbidity from injury during March was reported by these Commands (about 57 per thousand), while most of the other Service Commands reported rates of 40 per thousand or less.

RESPIRATORY DISEASES:

During March, the admission rate from colds, influenza, etc. decreased by about 15 percent to 167 per thousand, or the same as the rate for January 1945 and about 25 percent below the corresponding rate for March 1944. Morbidity from respiratory diseases at shore stations of the Navy in this country decreased by about 10 percent during March, although the level of morbidity experienced in the Navy was somewhat higher than for the Army.

Morbidity from colds, influenza, etc. decreased in

all Service Commands except the Seventh where an increase of about 10 percent was reported. Decreases of 20 percent or more were registered in the First, Third, and Sixth Service Commands. The Fifth Service Command again reported the highest morbidity from these causes (215 per thousand), followed by the Eighth Service Command and the Military District of Washington (about 190 per thousand). The lowest rates were reported in the First and Ninth Service Commands (about 155 per thousand). The admission rate from colds, influenza, etc. for the first three months of 1945 was about 35 percent lower than for the corresponding period of 1944.

Morbidity from all forms of pneumonia combined decreased by about 5 percent in March. The admission rate for March 1945 was about 15 percent lower than for March 1944. Most of the Service Commands reported moderate decreases in March. The Sixth Service Command again experienced the highest admission rate from this cause (20 per thousand), closely followed by the Fifth, Fourth, and Eighth Service Commands.

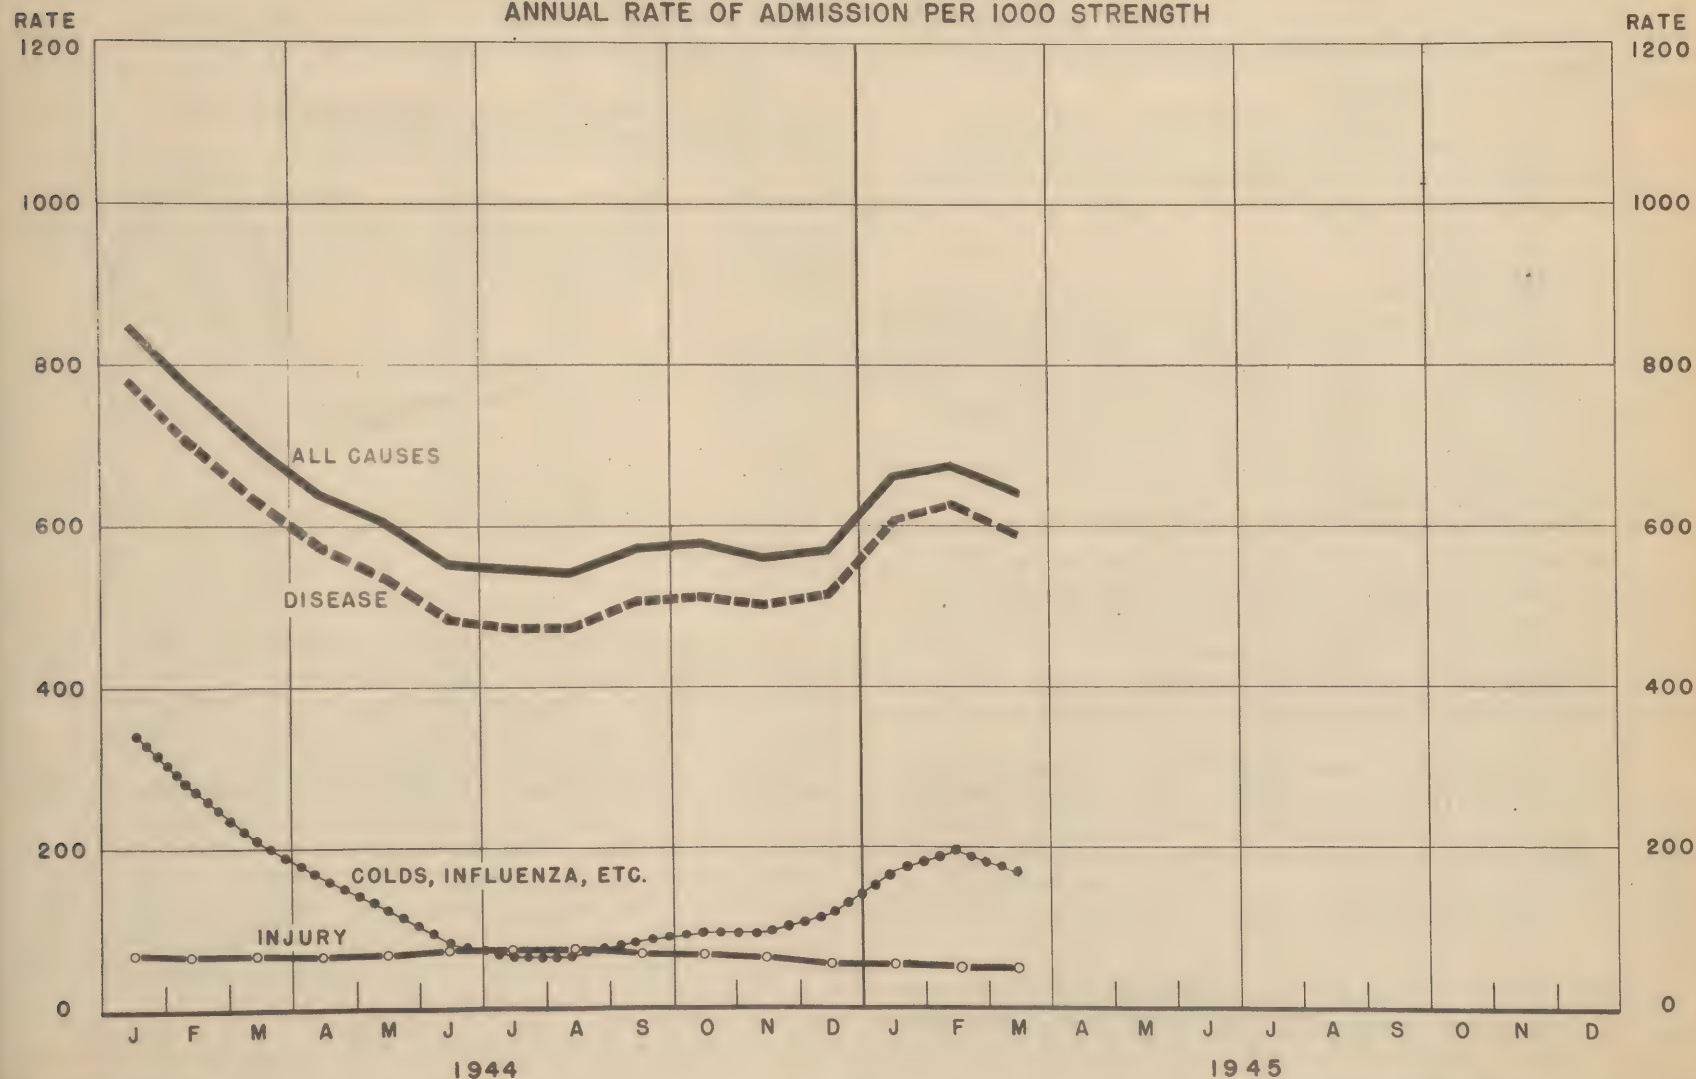

Morbidity from pneumonia during the first quarter of 1945 was about 30 percent lower than during the corresponding period of 1944.

In March, atypical pneumonia accounted for over two-thirds of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Fourth, Eighth, and Ninth Service Commands and the Military District of Washington, in all of which it exceeded 70 percent.

MORBIDITY FROM ——— ALL CAUSES ——— DISEASE

———— INJURY ——— COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased by about 20 percent in March and was at the lowest level reported so far during this war. The admission rate for March 1945 was about 15 percent lower than for March 1944. No Service Command reported a rate in excess of 8 per thousand.

Morbidity from this cause for the first three months of 1945 was about 15 percent lower than during the first quarter of 1944.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, decreased slightly during March, but was nevertheless higher than for any month of 1944 and about 50 percent higher than for March 1944. The Navy's morbidity from venereal disease during March was at a somewhat higher level than during February, and at about the same level as the Army's experience in March.

The admission rate for syphilis, excluding EPTS cases decreased by about 10 percent in March and was about the same as reported during most of 1944. The admission rate for venereal diseases other than gonorrhea and syphilis decreased slightly to .9 per thousand which is the lowest rate reported during this war.

Morbidity from venereal diseases, excluding EPTS cases, was about 50 percent higher during the first quarter of 1945 than during the corresponding period of 1944. All of the increase arose from gonorrhea since morbidity from syphilis remained about the same, while that for other venereal diseases decreased about 40 percent.

Most Service Commands reported about the same morbidity from venereal diseases excluding EPTS cases in

March as during February. The highest rate in March was reported by the Third Service Command (64 per thousand), followed by the First Service Command (50 per thousand). Only the Eighth and Ninth Service Commands and the Military District of Washington recorded rates of less than 40 per thousand.

The venereal disease cases remaining under treatment on 30 March are shown below:

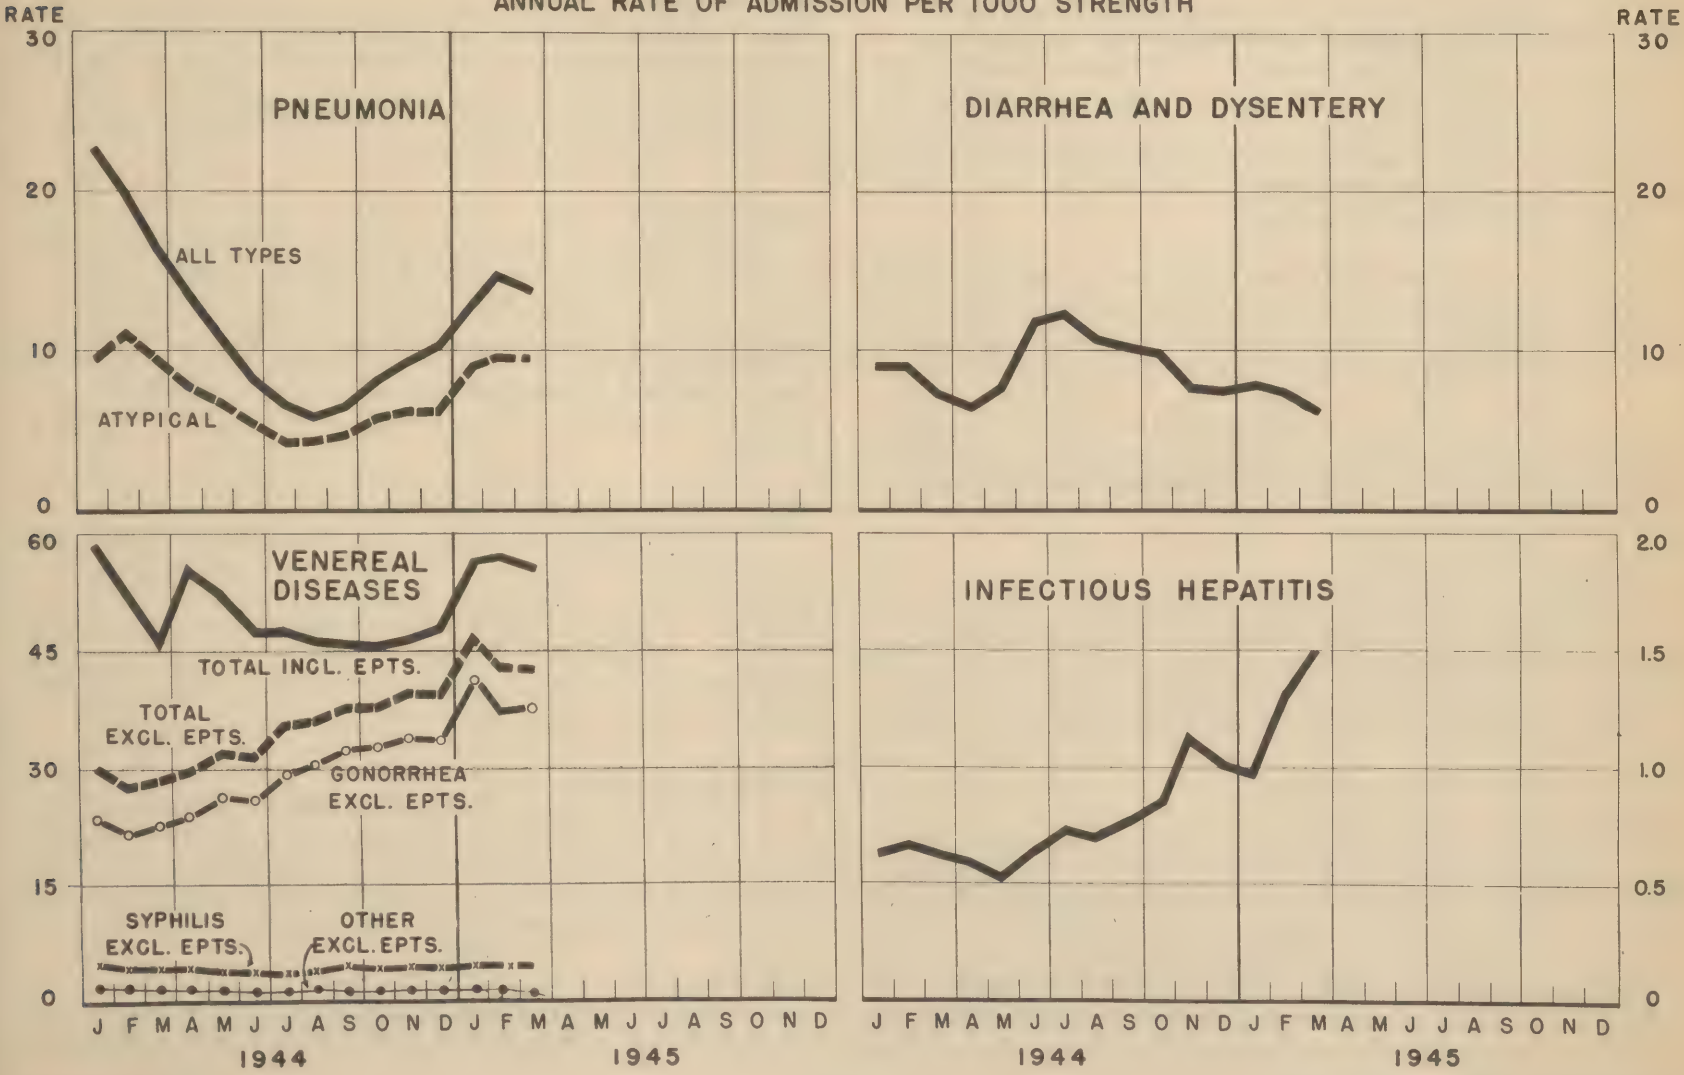

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of all Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1363	846	.55	.34
I	43	21	.4	.2
II	54	66	.3	.3
III	174	98	.8	.4
MDW	8	15	.2	.4
IV	327	207	.6	.4
V	45	57	.2	.2
VI	11	21	.1	.1
VII	70	47	.3	.2
VIII	447	212	1.1	.5
IX	184	102	.5	.3

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of March was 12 percent lower than for February, while the number of cases of other venereal diseases increased about 2 percent. Total venereal cases represented .89 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 10 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 60 percent of the cases remaining under treatment were syphilis cases.

MORBIDITY FROM—PNEUMONIA—DIARRHEA AND DYSENTERY

VENEREAL DISEASES—INFECTIOUS HEPATITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Morbidity represented by venereal EPTS cases was reported at 14.2 per thousand during February as compared with 9.7 per thousand for January. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees. The average weekly number of venereal EPTS cases in February was 788 as compared with 562 in January, reflecting the trend of the number of men inducted into the Army.

The total days lost from duty during March because of venereal disease were about 79,000 or an average of 15,800 per week; this represented a non-effective rate of .80 per thousand as compared with .83 in February.

Detailed data as to the March incidence of venereal diseases by color will be presented in a Special Health Report to be contained in Weekly Health Report No. 17.

INFECTIOUS HEPATITIS:

Morbidity from infectious hepatitis increased in March to 1.5 per thousand which is the highest rate reported since the epidemic in the summer of 1942. The First and Sixth Service Commands with rates of about 3.5 per thousand reported the highest morbidity from this cause.

MEASLES:

Morbidity from measles increased by about 30 percent in March and was reported at 3.3 per thousand reflecting a continuation of the anticipated seasonal upward trend. However, the rate for the first quarter of 1945 is only about one-third as high as for the corresponding period of 1944. The Seventh and Eighth Service Commands were the only ones to report admission rates in March notably in excess of the average for the

entire country.

MUMPS:

Morbidity from mumps increased by about 40 percent in March to 10.2 per thousand. This rate is almost as high as the peak rate of 10.6 per thousand registered in March and April 1944. Only the Fifth Service Command had morbidity appreciably in excess of that for the entire country.

SCARLET FEVER:

Morbidity from scarlet fever decreased slightly in March being reported at 2.7 per thousand. The admission rate from this cause for the first quarter of 1944 was only about one-half as high as for the corresponding period of 1944. Only the Sixth Service Command reported morbidity from this cause in March notably in excess of the average for the country as a whole.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis remained at about the same level as during the previous two months (about .6 per thousand). Thus the experience for the first quarter of 1945 is only about one-half as high as for the first quarter of 1944. The Fifth Service Command continued to be the only one to report relatively high morbidity from this cause.

RHEUMATIC FEVER:

Morbidity from rheumatic fever increased slightly to 1.0 per thousand, the highest rate reported since July 1944. Morbidity from this cause during the first quarter of 1945 has been only one-half as high as for the corresponding period of 1944.

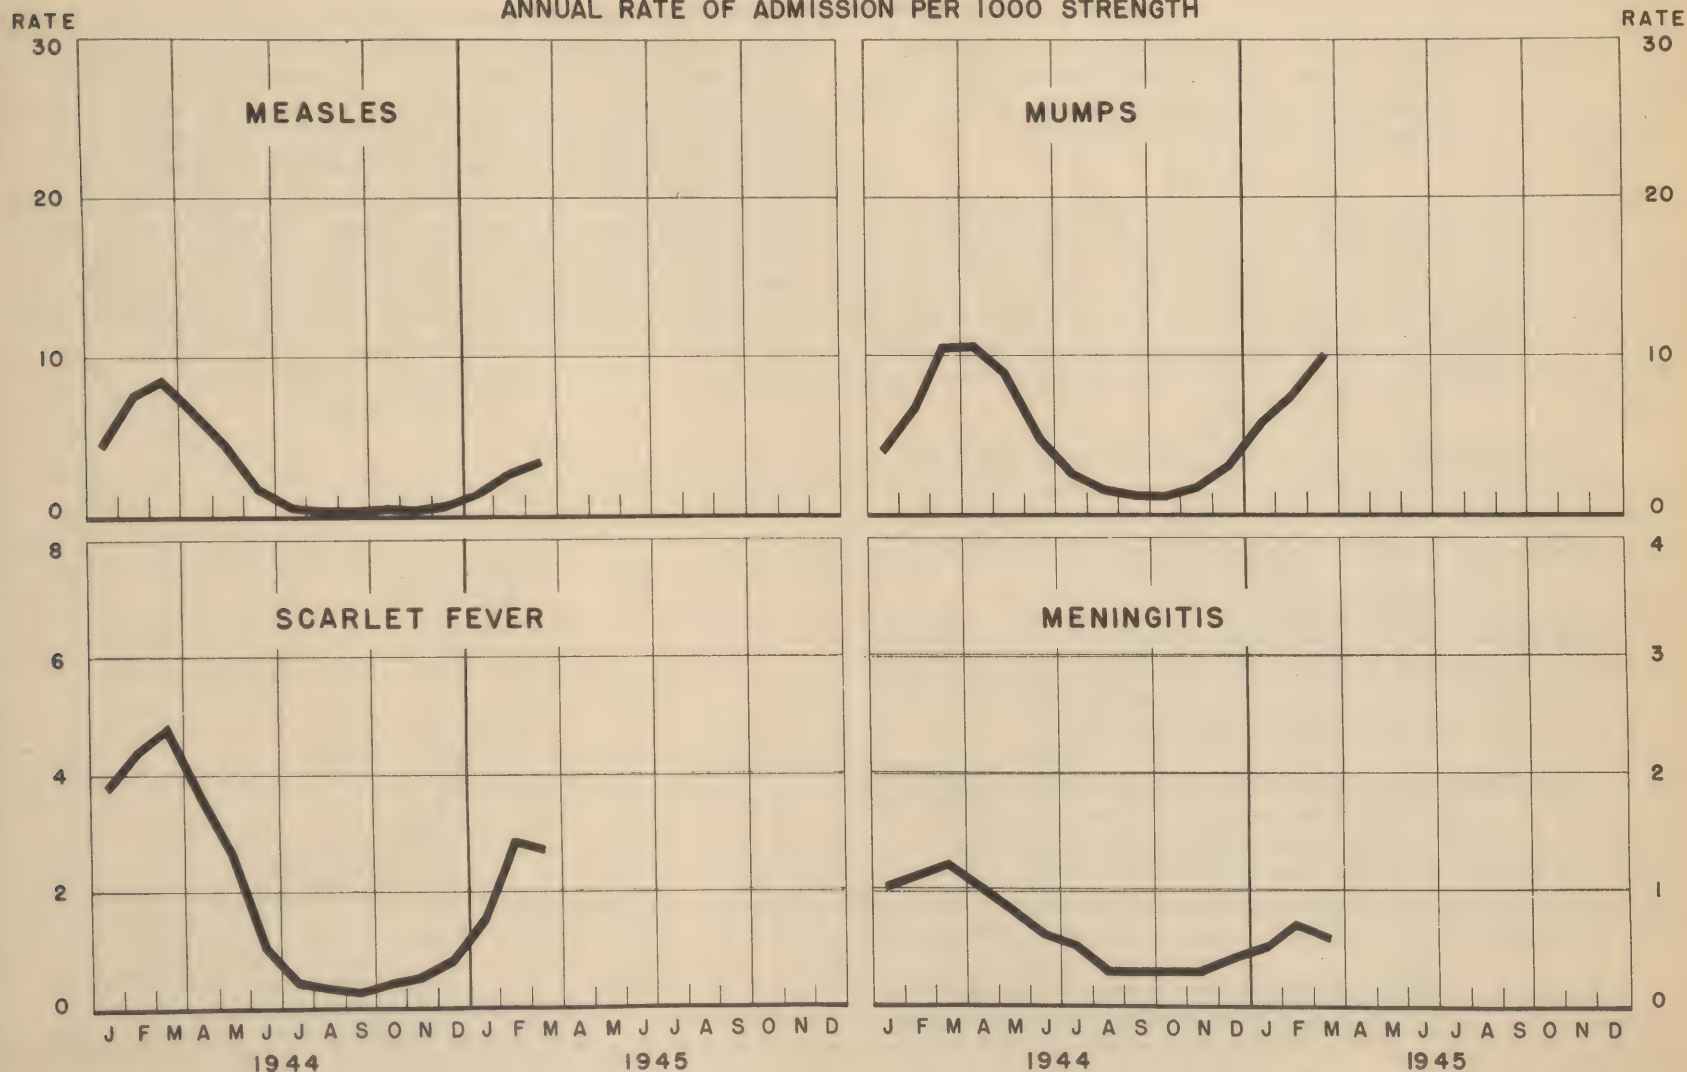

TUBERCULOSIS:

Morbidity from tuberculosis was reported at 1.0 per thousand in March or about the same as during the

MORBIDITY FROM — MEASLES — MUMPS

SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

preceding four months. This relatively high present level arises in large part from examinations at separation centers which tend to uncover cases that would otherwise pass by undetected.

As of 30 March there were 1711 cases of tuberculosis remaining under treatment; these represented .69 percent of all patients in hospital. Of the 1711 cases 893 were at Fitzsimons GH and 515 at Bruns GH.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .1 per thousand in March. The number of cases of malaria presumably acquired overseas which were admitted (or readmitted) for treatment in this country averaged about 1370 per week or about the same as the weekly average for February, and thus the highest figure so far recorded.

As of 30 March there were 3421 cases of malaria under treatment, representing 1.4 percent of all patients in hospital; only 10 of the 3421 cases were those where the disease was acquired in this country.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders increased slightly in March to 49.9 per thousand. This rate is at about the same level which prevailed during the previous six months.

During March there was an average of 2110 CDD's per week given to enlisted men classified as neuropsychiatric cases. This is about 20 percent higher than the weekly average during February. The CDD's in March in respect to neuropsychiatric disorders accounted for 45 percent of all CDD's or the same as in February.

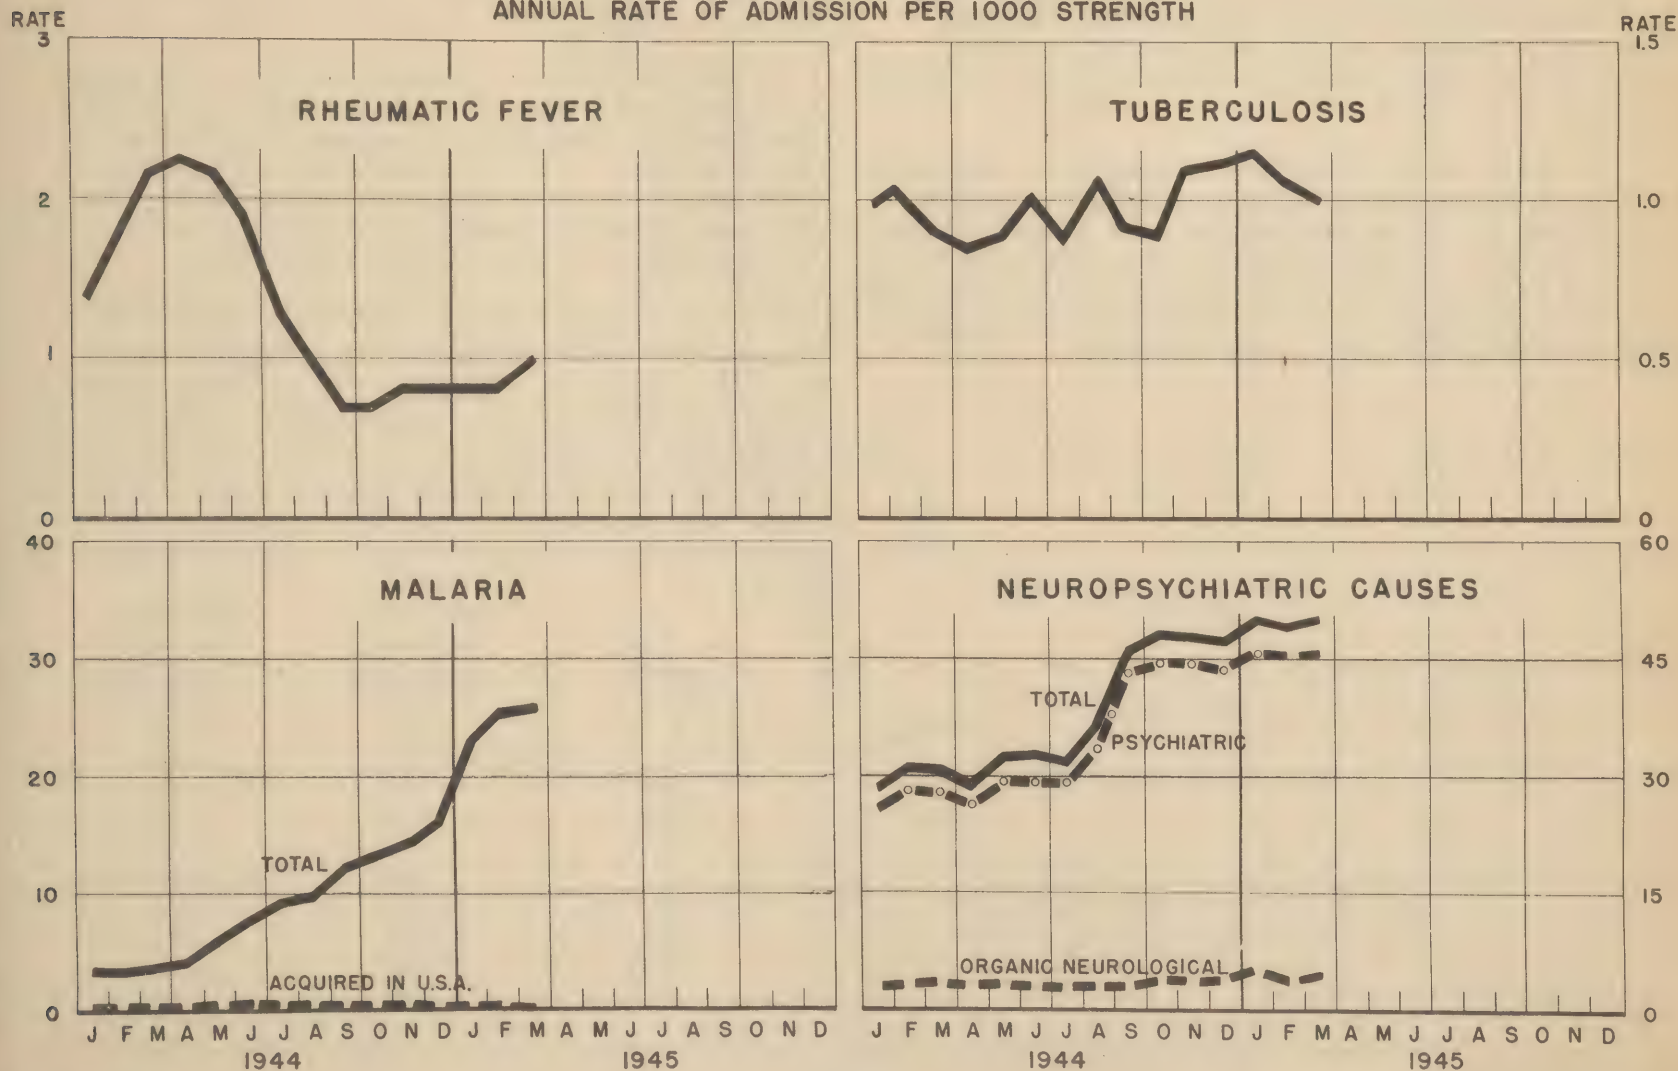

In March organic neurological cases accounted for 9 percent of all neuropsychiatric cases. Only in the

Third and Fifth Service Commands and MDW did the proportion of organic neuropsychiatric cases exceed 10 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 30 March was 34,333 or about 2,900 more than at the end of February and thus the highest number reported so far during the war. During March the number of locked ward cases decreased by about 10 percent, whereas the number of open ward cases increased by about 15 percent, with most of the rise being reported in the First, Third, Fourth, and Sixth Service Commands. Neuropsychiatric cases remaining represented 13.9 percent of all patients in hospital, with open ward cases being 11.8 percent and locked ward cases 2.1 percent.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY:

Mortality from all causes during February was reported at 2.31 per year per thousand strength. The mortality rate from disease increased from .74 per thousand in February to .80 per thousand in March, while the reported mortality rate from injury increased from 1.34 per thousand to 1.40 per thousand.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 1.6 per thousand, resulting in an estimated total death rate from all causes of 2.5 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in this country was about 34 per thousand in March or slightly lower than in February.

The mean number of non-effectives (including evacuees from overseas) for March was reported at 85 per thousand strength or 10 percent higher than in February; most of this increase arose because of an increase in hospital population at General Hospitals. The mean number of injury non-effectives per thousand strength in March was 14.3 per thousand.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General and Convalescent Hospitals in each Service Command. When comparisons are made between the rates excluding such hospitals, the variations by Service Command are seen to be very much smaller than when the days lost in these hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. and Conv. Hosp.</u>	<u>Excluding Gen. and Conv. Hosp.</u>
